Report of the Development Committee

on

Internationalization

INTERNATIONAL ORGANIZATION OF SECURITIES COMMISSIONS

October 1993

Foreword

The Development Committee, which is made up of more than 40 members of the International Organization of Securities Commissions ("IOSCO") that regulate emerging securities markets, has endorsed on October 25, 1993 this Report from its Working Group on Internationalization and has authorized its public release during the XIXth Annual Conference of the Organization. The first part of the Report, prepared under the chairmanship of the Superintendencia de Valores of Columbia, contains an up-dated summary that includes the answers provided by 23 members of the Organization to a questionnaire on internationalization which was prepared by the Working Group. The objective of the Development Committee of IOSCO is to promote the development of emerging securities markets, in particular, by the exchange of pertinent information and the implementation of common standards.

hackene

The Development Committee, which is made up of more than 40 members of the International Construction of Sequence Commissions (*108CO*) that regulate emerging accurities mediate, have endomed on October 25, 1993 this Report from its Worlding Group on Internationalization and has authorized its public release during the XIX" Annual Conference of the Organization. The literal part of the Report, prepared under the chairmanship of the Superintendencia de Valores of Cotumbia, contains an up-dated summary that includes the answers provided by 23 members of the Organization to a quostionnaire on informationalization which was prepared by the Working Group. The objective of the Development Committee of IOSGO is to promote the development of emerging securities markers, in particular, by the exchange of perfinent information and the implementation of common standards.

When presenting the report on internationalization of the emerging capital markets that has been previously sent to you, we deem it neccessary to make some additional comments regarding the information obtained after the expiration of our dead-line to send this report to the General Secretariat of IOSCO.

I. JUSTIFICATION

As was stated in the report that was sent to you, the questionnaire on Internationalization was sent -in accordance with the Development Committee decision- to the regulatory agencies of all Committee members, and to several others in countries with developed markets. Seven (7) new countries responsed, so that the report was prepared based on the information provided by fifteen (15) agencies, including Colombia. We know that this information can not be considered representative, but it is in any case a better sample than the one upon which the Nairobi's, report was based.

The Colombian Superintendency, conscious of the seriousness of its committment as Chairman of the Internationalization Work Group, was not satisfied with preparing and sending the report within the term given by the IOSCO General Secretariat. We continued our task, obtaining eight (8) additional answers, which we consider highly useful for the purposes of this group.

We specially appreciate the cooperation of the regulatory agencies from Spain and Sweden, since the information provided by them illustrates which our goals shall be, and in which direction our efforts shall be made, toward the internationalization of our capital markets.

At the end, we evaluated the answers of twenty three (23) agencies, which gives us a better idea about the stage of internationalization reached by each of our Capital Markets, and the main problems faced by them during their legal harmonization process. We can also evaluate the improvements that each country has made in terms of financial innovation, and liberalization of their capital markets, i.e. allowing local issuers to turn to foreign markets and the simultaneous opening of the markets to the foreign investors.

II. RESULTS

In order to update the information regarding the countries to which the questionnaire on internationalization was sent and those that provided the information requested, we prepared the following chart:

III. ANALYSIS OF THE OBTAINED ANSWERS

3.1. Raising Sources

Regarding this point, the conclusion stated in the report delivered to you prevailes, since the majority of the enquired countries (18 out of 23) have had placed local issues in foreign markets. Only Poland, Uruguay, Nigeria, Jordan and Mauritius have not used this mechanism.

The conclusion in accordance to which the internationalization of the capital markets does not happen both ways with the same intensity, is still valid. It appears to be more frecuent that local issuers turn to foreign markets in order to obtain financial sources, than the placement of foreign securities in the local markets. The obtained information shows that foreign placements have been carried out in only eight (8) of the enquired countries. This countries are: Argentina, Colombia, Costa Rica, Brasil, Uruguay, Singapore, Spain and Sweden.

Turning to financial instruments, ADR's, GDR's, stocks and Eurobonds are still the most frecuently used, being London, the United States and Luxembourg the preferred markets to place them. In the cases of Spain and Sweden, their placements are also made in the European markets (EC).

The lack of legal harmonization, as well as different accounting standards were mentioned as the main problems faced when placing local issues in foreign markets.

In order to avoid being repetitive, we will only point out the case of Poland which we consider illustrative. The Polish Securities Commission is not favourable, for the time being, to the issue of securities by local entities abroad. The reason for this being the relatively small size of the market, its local character and the risk of arbitrage between the local and foreign markets, which they suspect would have a negative effect on the Polish Market. This should be understood as a temporary measure, keeping in mind the current features of the Polish economy.

Beside routine problems regarding the adaptation of the "prospectus" to the rules aplicable in the market where the placement shall take place-which have been easily overcome- Spain mentioned the differences in the accounting standards when the issue is going to be placed in the United States.

When answering the question regarding the problems faced by foreign issuers during local placements, allmost all the countries mentioned legal and accounting differences, aswell as the market's limited absortive capacity for a large offering. Please keep in mind that this question was answerred as "Not applicable" by most of the countries. Therefore, the information provided hereby shall be understood in this context.

Regarding the use of underwriters, the conclusion is still the one stated in the report, since only Argentina, Singapore, Spain and Sweden have some experience with this mechanism.

3.2. Restrictions

With respect to this point, in which the improvements in terms of internationalization can be realized, many countries mentioned some kind of restrictions for the sale of local securities in foreign markets or for the placement of foreign securities in the domestic markets.

Argentina, Paraguay, Egypt, Uruguay, Guernsey and Singapore are the only countries with no legal restrictions for this kind of transaction.

It is worth mentioning that this transactions are not subject to any kind of restrictions, neither in Spain nor in Sweden.

Most of the enquired countries do not allow the local placement of bonds issued by foreign governments and the local placement by foreign issuers are -in almost all countries- subject to special regulations different than those applicable to local securiites.

3.3. Positive and Negative Effects

In addition to the positive effects mentioned in the report, it is worth mentioning that the regulatory agency of Singapore states that the internationalization of its capital market has generated the growth of their secondary market. The Indian Securities Commission mentiones that the private investments have increased, supplementing the industrialisation of their economy.

As negative effects produced by the internationalization, an increase in the volatility of the stocks prices was mentioned by several countries.

3.4. Foreign Investment Participation in the Securities Markets

The influence of internationalization in the emerging capital markets is particularly evident in this answer. Only in two (2), out of twenty three (23) countries some kind of restrictions regarding repatriation of capital are still applicable to foreign investment (Chile and Mauritius).

3.5. Tax Treatment

Regarding the tax treatment given to foreign investment in each enquired country, the trend to provide equal treatment to foreign and national investment prevails. Only seven (7) countries grant identical tax treatment to foreign and local investment.

3.6. Privatization

After analysing all the answers obtained, we can conclude that privatization of state properties have taken place in twenty one (21) of the twenty three (23) enquired countries. In twelve (12) of this countries, said privatizations have been carried out - at least partially- through the stock exchanges.

Although the purpose of privatization is not to strengthen the securities markets, the enquired countries declared to have perceive positive side-effects in terms of development and growth of said markets.

The case of Poland deserves a special comment, since 95% of the total amount traded in the stock exchange during 1992 corresponds to privatizations. Seventeen (17) out of nineteen (19) companies listed on the Warsaw Stock Exchange were privatized by public offering. Approximately a 75% of the privatized entities (both, by way of public offering and by private placements) was acquired by foreign investors.

Although this figures can be imprecise -as the Polish Securities Commissions warned- they show us the importance of privatization as a development tool for the capital markets, as well as an instrument to achieve its internationalization.

3.7. Rating Agencies

The answers obtained show that most of the enquired countries do not have rating agencies at this moment. India, Chile, México, Argentina and Korea currently count with this kind of agency, aswell as Spain and Sweden.

Colombia and Costa Rica are currenty in the process of authorizing the creation of rating agencies in their countries. In Colombia, the first rating agency is expected to be in operation before the end of this year.

It is worth mentioning that, with the exeption of Spain and Sweden. the evaluations performed by the existing rating agencies are not accepted abroad.

3.8. Central Depositors of Securities

Eleven (11) out of twenty three (23) agencies mentioned the current existance of Central Depositors, which in most of the cases are in charge of the clearing and settlement of securities transactions. Only six (6) of the existing Depositors have international links.

3.9. Memorandums of Understanding (MOU's)

This instruments, known as an important tool for the assistance and cooperation between regulatory agencies of different countries, is not used as often as it would be desirable. In fact, most of the enquired agencies stated to have signed or to have initiated negotiations for the signature of MOU's with other agencies. Nevertheless, there are still eight (8) countries that did not mention any plans to suscribe this kind of agreements. India is a special case, since allthough they do not have signed MOU's as such, the Indian Securities and Exchange Board has been exchanging information with other regulatory agencies of IOSCO members.

Most of the countries mentioned the existance of Information Exchange Agreements. In fact, only five (5) regulatory agencies do not have exchange of information with other countries.

Regarding the agreements for the cross-listing of stocks, only Argentina and Paraguay have signed this kind of agreement, within the scope of MERCOSUR. Venezuela has initiated negotiations within the scope of the Latinamerican Reserve Fund for this purpose.

CONCLUSION

Having said the above, we can go back to the conclusions reached in the original report, since excepting the issues that were specifically mentioned, the conclusions and trends in terms of internationalization of the emerging capital markets are totally valid.

RECOMMENDATIONS

Based on the answers obtained, as well as on the above comments, we consider it convenient to make the following recommendations:

- 1. We note that the main task to be performed by the Development Committee is to attract the atention of its members toward internationalization as an important goal for their markets; thus, stimulating the countries interest in taking active part in the internationalization process and in learning how to handle the inherent risks in order to reduce the fear that some countries might have in this respect.
- 2. We also deem very important that the members of the Development Committee have permanent access to the changes and improvements achieved internationally regarding regulation, procedures, requirements and accounting standards, in order to enforce the measures necessary to adjust their local rules to said improvements.

All of the above will allow us to take great strides in the harmonization process, as a first step toward internationalization.

3. Regarding prevaling restrictions to the placement of local securities in a foreign markets and to the placement of foreign securities in the local markets, we think that IOSCO has a great task to perform through its Development Committee. This could be achieved by updating the existing information on international systems and regulations, thus supplying all countries with knowledge of the evolution and improvements made in this area. Based on said information, the countries can begin their process toward the harmonization of their local rules, procedures and requirements, gradually eliminating restrictions to the mentioned transactions. We suggest the creation of a work group for this matter, which would be in charge of making the follow-up on improvements and adjustaments in this important area.

- 4. Recognition of the positive economic effects of internationalization of the securities markets strengthens the need to speed up said process with concrete measures that shall be adopted hereby. Thereby, after having identified several inconveniences faced by the emerging markets during the internationalization process, we consider convenient to organize regional groups that could design general quidelines to solve their principal problems. It could be important to establish, for example, regional standards regarding the qualification of rating agencies and the criteria and systems for rating, so that the evaluation made by a local agency could be recognized or accepted in other countries. This would clearly simplify the internationalization of securities in those countries interested in said process.
- 5. Finally, the duties of the Central Securities Depositary Organizations as well as those of the Clearing Houses should be directed to reach an efficient settlement of international transactions. Therefore, the structure of said entities should be harmonized in order to support their integration. Said integration provides the harmonization of settlement and clearing systems, from an international perspective. For this purpose we would suggest that each of our countries adopts the recommendations of the G-30, which are contained in its study know as the "Blue-Print".

We still have a long way to go to reach these goals. We hope to count on your contribution to work towards the internationalization of our securities markets in order to be able to offer financial alternatives to foreign investors, according to the world's trends.

Recognition of the positive economic effects of internationalization of the securities markets strengthens the need to speed up said process with concrete measures that shall be adopted hereby. Thereby, after having identified several moonveniences faced by the emerging markets during the internationalization process, we consider convenient to organize regional groups that could deagn general outdelines to solve their principal problems. It could be important to establish for example, regional standards regarding the qualification of rating agencies and the cutaries and systems for rating, so that the evaluation made by a local agency could be recognized or accepted in other countries. This would clearly simplify the cutarmationalization of securities in those countries interested in said process.

5. Finally, the duties of the Central Securities Depositary Organization as well as mose of the Clauming Houses should be directed to reach an efficient settlement of international transactions. Therefore, the structure of said entities should be betweenized in order to support their integration. Said integration provides the barmonization of settlement and clearing systems, from an international perspective. For this purpose we would suggest that each of our countries sciopts the recommendations of the G-SC, which are contained in its study know as the "Blue-recommendations of the G-SC, which are contained in its study know as the "Blue-recommendations of the G-SC, which are contained in its study know as the "Blue-recommendations of the G-SC, which are contained in its study know as the "Blue-recommendations of the G-SC, which are contained in its study know as the "Blue-

We still have a long way to go to reach those goels. We hope to count on your contribution to work towards the internationalization of our securities markets in order to be able to offer financial alternatives to foreign investors, according to the world's treates.

THE INTERNATIONALIZATION PROCESS IN EMERGING MARKETS EVALUATION OF SOME EXPERIENCES

1. FOREWORD

As it was explicit in the internationalization of emerging markets report presented last year by the Chilean Superintendency of Securities and Insurance, the internationalization of capital markets is not only an evident fact characteristic of our days, but also an unavoidable process.

Therefore, the analysis of our capital markets behavior toward this inevitable trend of the financial world is not only justified but also an imminent need.

As Chairman of the Internationalization Work Group and in compliance with its assignment, the Colombian Superintendency of Securities prepared a questionnaire (Attached as Appendix I hereto) designed to detect the principal obstacles faced by our countries in their recent internationalization process.

In preparing this questionnaire, we were conscious that the sharing of our markets internationalization experiences supports and accelerates their legal, technical and financial adaptation process; in order to be able to actively participate in the imminent internationalization process which none of our countries -I am sure- wants to stay out of.

Therefore, firstly the questions intended to identify the stage of internationalization reached by each of our capital markets and the main difficulties found by the member countries of the Development Committee during this process.

Secondly, we formulated several questions, in accordance with the conclusions and recommendations of the Chilean report, to find out if the internationalization has produced the expected effects which were the technical and financial sophistication of the domestic markets. This questions tried to establish if the improvements reached in the process of harmonization of rules, procedures, requirements and accounting standards, which were identified by the mentioned report and by the Development Committee as the most important tools for the internationalization of our markets, had been achieved.

This report presents the main results of the recent internationalization experiences in the emerging markets. A brief reflection about the internationalization of the questionnaire, methodology used and the answers to the same, concluding with our conclusions and recommendations.

2. INTERNATIONALIZATION OF SECURITIES MARKETS

Before coming to the analysis of the obtained answers, we would like to briefly emphasize the importance of the securities markets internationalization for the countries interested in advancing in the process of internationalization of the productive system.

The securities markets have recently acquired a major theoretical importance for macroeconomics and for finance.

The extensive use of the intemporal optimization models in the analysis of consumption and investment has clearly evidenced its integration. This is how managerial investment decisions, explicit evaluations of risk and the role of uncertainty, among other factors, tend to point out the securities markets' function in economy, and particularly with respect to investment decisions facing internationalization.

It is of general knowledge that the important financial markets have traditionally been the monetary and the debt markets. Nevertheless, this concept has been underestimated during the present discussions of the fiscal and monetary policies regarding investment. Therefore, the securities market remains as a key financial market, even though the companies still obtain significant financing through debt.

The importance of the securities markets proportionates to the effectiveness of the cross border integration process. This is basically caused by the need for modernization of the productive system, since it is expected that the opening of the capital markets will be consolidated, thus facilitating the financing of companies.

Nevertheless, the awaited internationalization process has not been as simple and as rapid as be desired, since the characteristics of each domestic market do not allow it.

There is no doubt about the benefits of market internationalization, since integration contributes to development, increases competition and the efficiency level of the domestic markets, as was concluded in the Chilean report. Furthermore, internationalization will provide significant support to economic growth, increasing capital sources and widening investment alternatives. On the other hand, managers have the possibility to count with more reasonable financial sources and to contact foreign shareholders, increasing their confidence in the productive process.

If the benefits of securities market internationalization are clear, the adoption of free mechanisms which makes said integration possible cannot happen as quickly as necessary, since structural conditions, such as market stability, communication systems and the laws ruling the market delay the integration process.

2.1. The Questionnaire

2.1.1. Purpose

As stated above, the questionnaire was prepared in order to identify the improvements reached by each market in its internationalization process. The questions were also formulated based on the conclusions and recommendations presented in the Chilean report last year.

The questionnaire was divided into four parts. The first, titled "Experiencies", seeks to find the internationalization activities that each market has been carrying out, specially regarding the signature of assistance and cooperation agreements, as well as agreements for the exchange of information. This part also included questions regarding the experiences of each market placing foreign securities in their country and/or placing local securities abroad.

In the second part, the questions are designed to obtain information about the financial instruments used by local issuers to obtain financial sources in international markets and by foreign issuers to raise financial sources in the local market.

The third part refers to the harmonization of rules, requirements and procedures in order to be able to establish the improvements reached in this area by each market.

The fourth part seeks to obtain information that allows us to evaluate the economic effects of internationalization and to gather data about the tax and exchange treatment provided for foreign investment in each country.

Lastly, we request several economic indicators that will supply us with a basis on the size of each market.

2.1.2. Methodology

The questionnaire was designed to obtain concrete answers to be received by fax.

In the same way, the questionnaire was divided into subjects in order to make it easy to answer. We also opened the door for the enquired countries to provide us with any additional information that could be relevant to our report.

2.1.3. Results

It should be mentioned that the questionnaire was initially sent to 15 countries, obtaining answers from only 8,1 including Colombia. Based on said answers, the Colombian Superintendency of Securities prepared a preliminary report that was presented before the Working Group on Internationalization at the Development Committee meeting held in Nairobi on Mai 1993. During said meeting it was agreed to sent the questionnaire to more countries, in order to obtain a more representative sample that would allow us to achieve better conclusions. Therefore, the questionnaire was sent to the regulatory agencies of all Development Committee members, and to several other agencies in countries with developed markets, in order to de able to compare their answers with those provided by the emerging markets. This time, we obtained answers from seven (7) other emerging markets, so that we compared the answers of fifteen (15) countries. The information obtained is considered very useful for our report.

In the following chart you can find the agencies we sent the questionnaire to, and those that provided us with an answer.

2.1.3.1. Raising Sources

Regarding the raising of financial sources by local issuers in foreign markets, all countries except Mauritius and Jordan have used this mechanism. Argentina, Costa Rica, Brazil and Colombia are the only countries that have experienced raising financial sources by foreign issuers in their local markets.

This shows that internationalization of securities markets does not happen both ways with the same intensity, and that the economic units of each country are turning to foreign markets - specially to developed markets - to obtain financial sourses, while domestic markets are still not prepared to offer financial alternatives to foreign investors.

Almost all the countries have signed or are planning to sign cooperation agreements with other countries. It is worth mentioning that the Latin American countries have signed more agreements then any of the other enquired countries, being Perú the only exception.

ADR's, GDR's, Stocks, Warrants and Eurobonds are the main financial instruments used to obtain sources abroad. They were mainly placed in the United States, Luxembourg and London, and in Japan in the case of brazilian bonds.

The lack of harmonization of rules and authorization processes, as well as the high costs of foreign placements were mentioned as the main problems faced during the internationalization process. The complexity of the United States regulations for this kind of transactions, and the difficulty in determining the price for the securities to be placed abroad, together with the strengh disclosure requirements were mentioned as significant problems by almost all the enquired countries.

In general terms, the answers show that the countries enquired have not a significant experience regarding the use of underwriters. Argentina is the only exception.

We deem it convenient to mention that eight (8) of the fifteen (15) countries have a Central Securities Depository and that two countries mentioned that the authorization will be granted soon. Only five (5) of the existing Depositories have international links.(Argentina, Brazil, Costa Rica, Chile and México).

2.1.3.2. Restrictions

Perhaps the most significant issue with respect to the improvements achieved in the internationalization process refers to restrictions in the sale of local securities abroad and in the sale of foreign securities in the local markets. Five (5) of the enquired countries (Thailand, Chile, Mauritius, México and Brazil) mentioned restrictions to this kind of sale. Colombia, Korea and Costa Rica do not provide restrictions, but authorization from the regulatory agency must be obtained. Some countries, like México do not permit the sale of stocks or other foreign securities in their markets.

Almost all the countries have special rulings for the placement of securities by foreign issuers in their markets. In Argentina, Bolivia, Costa Rica and Egypt, said placements are subject to the general rule applicable to local placements.

Nevertheless, nearly all the countries are making efforts to achieve the harmonization of disclosure requirements and regional integration with other securities markets.

2.1.3.3. Positive Effects

The possibility for corporations to obtain more advantageuos financial sources for modernization is considered by all the countries the main positive effect of internationalization. In the same way, it is pointed out that internationalization allows

financing important investment projects that could hardly be financed through domestic sources.

From the answers received, it is clear that internationalization of the securities markets offers corporations the possibility to count with better leverage, reducing the interest rate charged by the financial sector.

Foreign capital flow affects international reserve levels and influences market liquidity. Said capital can also help to achieve stable interest rates, by means of reaching higher liquidity levels. If foreign capital flow significantly increasies money circulation, monetary policy can face serious difficulties. According to the numbers and quantities provided by the enquired countries, such an effect is not likely to be caused by foreign investment. On the contrary, it seems that its result has been a contribution to interest rate stability, which acording to the available information, reached in 1992 an average level inferior to the preceding years's. Only in Venezuela and Brazil the percentage of international reserves represented by foreign investment was bellow 18% (Please see the Table of Indicators).

2.1.3.4. Foreign Investment Participation in the Securities Markets.

Foreign investment in securities markets which have not been traditionally open to this kind of investment has contributed to increase the demand for securities during 1992. This has been identified as a reason for the historical stock prices growth.

The importance of foreign capital funds in emerging markets is clear. Even though the information provided is not enough to reach conclusions, (nearly all the countries did not have the corresponding information) their portfolios consist mainly of the secondary stock market negotiations ².

2.1.3.5. Tax Treatment

Regarding the tax treatment given to foreign investment in the enquired countries, there is evidence of a trend to provide equal treatment to national and foreign investment. Only Thailand gives a substantially different treatment to foreign investment. In Korea, the tax treatment depends on the existance of bilateral treaties. In Venezuela income tax is different for foreign investment. Mauritius mentions different treatment without going into detail.

²/In Chile and in Colombia, a big part of fund investments has been directed to buy stocks in the secondary market.

2.1.3.6. Rating Agencies

Only México, Chile, Argentina and Korea have rating agencies since 1988, (1983 in Korea). The Comisión de Valores of Costa Rica has already authorized the incorporation of one Rating Agency that should be in operation on January 1994. Although the evaluations made by a local rating agency are not internationally accepted, the enquired countries mentioned the benefits of said acceptance for market integration.

2.1.3.7. Privatization

The sale of state properties through stock exchanges as an instrument to widen the property and to grant transparency to the privatization process has not been significantly used in the enquired countries. Only in Brazil 100% of the privatizations have been carried out through the stock exchanges, while in Thailand and Perú this processes were partially performed trough the exchanges. Nevertheless, the information provided by the countries indicates that said sales have had an impact on the securities market. Although the purpose of privatization has not been to strengthen the securities markets, positive side-effects seem to have occured.

3. Recommendations

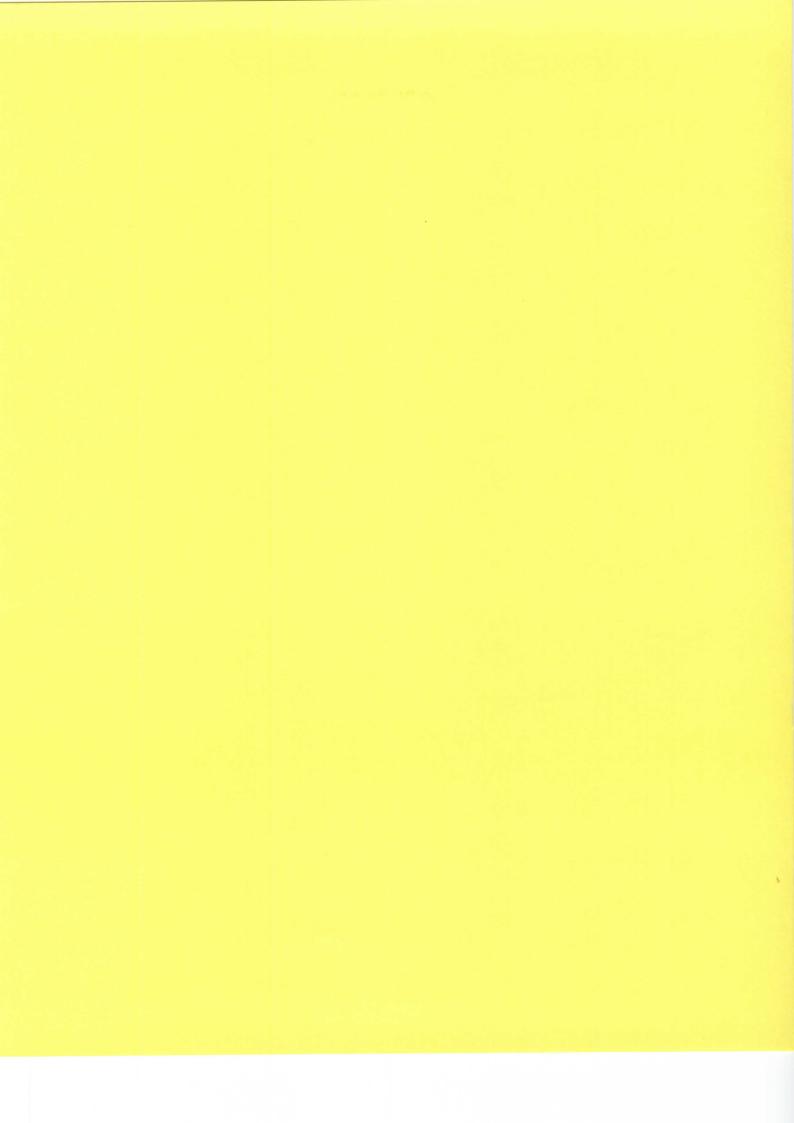

Based on the answers obtained, as well as on the above comments, we consider it convenient to make the following recommendations:

- 3.1. We note that the main task to be performed by the Development Committee is to attract the atention of its members toward internationalization as an important goal for their markets; thus, stimulating the countries interest in taking active part in the internationalization process and in learning how to handle the inherent risks in order to reduce the fear that some countries might have in this respect.
- 3.2. We also deem very important that the members of the Development Committee have permanent access to the changes and improvements achieved internationally regarding regulation, procedures, requirements and accounting standards, in order to enforce the measures necessary to adjust their local rules to said improvements.

All of the above will allow us to take great strides in the harmonization process, as a first step toward internationalization.

- 3.3. Regarding prevaling restrictions to the placement of local securities in a foreign markets and to the placement of foreign securities in the local markets, we think that IOSCO has a great task to perform through its Development Committee. This could be achieved by updating the existing information on international systems and regulations, thus supplying all countries with knowledge of the evolution and improvements made in this area. Based on said information, the countries can begin their process toward the harmonization of their local rules, procedures and requirements, gradually eliminating restrictions to the mentioned transactions. We suggest the creation of a work group for this matter, which would be in charge of making the follow-up on improvements and adjustaments in this important area.
- 3.4. Recognition of the positive economic effects of internationalization of the securities markets strengthens the need to speed up said process with concrete measures that shall be adopted hereby. Thereby, after having identified several inconveniences faced by the emerging markets during the internationalization process, we consider convenient to organize regional groups that could design general quidelines to solve their principal problems. It could be important to establish, for example, regional standards regarding the qualification of rating agencies and the criteria and systems for rating, so that the evaluation made by a local agency could be recognized or accepted in other countries. This would clearly simplify the internationalization of securities in those countries interested in said process.
- **3.5.** Finally, the duties of the Central Securities Depositary Organizations as well as those of the Clearing Houses should be directed to reach an efficient settlement of international transactions. Therefore, the structure of said entities should be harmonized in order to support their integration. Said integration provides the harmonization of settlement and clearing systems, from an international perspective.

We still have a long way to go to reach these goals. We hope to count on your contribution to work towards the internationalization of our securities markets in order to be able to offer financial alternatives to foreign investors, according to the world's trends.
